Hydrogen Under Extreme Pressure

Isaac F. Silvera

Lyman Laboratory of Physics
Harvard University
Complexity in Simplicity

Hydrogen is conceptually the simplest atom and molecule, and in many ways has been the most complex and challenging to theorists to predict properties.

The problem: zero-point motion & energy

The phases and properties with increasing density are rich and fascinating.
At the end of the rainbow is a pot of gold: metallic hydrogen.

Today, I want to discuss two pathways to the end of the rainbow:
low temperature isotherm and high temperature, above the melting line.
# The Hydrogens at High Pressure

The Wigner-Huntington Transition to Atomic Metallic Hydrogen (1935)

Predicted pressure 25 GPa

- Molecular solid insulator
- Molecular metal
- Atomic metal
The Known High Pressure Molecular Insulating Phases

Predicted transition pressure: 250 Kbar (0.25 megabar or 25 Gigapascal (GPa))
The Experimentally Visited High Pressure Phases

Phase Diagram of Deuterium

- \( \alpha-D_2 \), IR, run 1
- \( \alpha-D_2 \), IR, run 2
- mixed crystal, Raman, run 2
- mixed crystal, IR, run 2
- mixed crystal, Raman, Homley et al.

LP (I)  
BSP (II)  
D-A (III)
The LP (low pressure) phase in Ortho Deuterium (J=0)

(Hydrogen is similar)
Zero pressure: Both para hydrogen and ortho hydrogen crystallize in an HCP lattice. Para remains HCP to P=0;

Para molecules have spherical quantum mechanical distributions;

They are not orientationally disordered, but in a “symmetric many-body state”
The BSP in Ortho Deuterium (J=0)  
(Hydrogen is similar)
The BSP phase is of orientational order. Originally predicted to be Pa3, but identified as P3-bar (in deuterium) by Goncharenko and Loubeyre (neutron scattering).

**Pa3** structure from Raman Scattering spectra of librons at zero pressure.

P3-bar is similar but more complicated—not on fcc but hexagonal underlying structure of molecular centers.

Above $T_c$ the molecules are orientationally disordered.
The A-phase in Ortho Deuterium (J=0) (para-Hydrogen and HD are similar)
The A-phases: molecules are orientationally ordered but not in well defined spherical harmonic quantum states.

Molecules are in classical ball and stick states.

The solid is an insulator, not a metal!

The structure is not known.
Solid Metallic Hydrogen

Pressure → Pressure

Molecular solid insulator → molecular metal → atomic metal
Solid Metallic Hydrogen: Theory, Predictions

- **Metal Insulator Transition in Solid Hydrogen--0.25 megabar**
  Wigner, Huntington, 1935

- **High Temperature Superconductivity in Atomic Metallic Hydrogen**
  Ashcroft, 1968

- **Molecular metal at high pressure**
  Harris, Monkhorst, 1971

- **Metastability, liquid at T=0 K**
  Brovman, Kagan, Kholas, 1972-- Salpeter-perhaps unstable to recombination

- **Calculations of the critical pressure for metallization-- 1 to 20 megabar**
  A few dozen published and unpublished calculations by a large number of researchers
  1950’s to present day-- Difficulty with ZPM, fermion node problem, assumed structures

- **Negative slope in the melting curve; new phase lines in the melt; possible liquid at T=0 K**
  Scandolo, 2003; Bonev et al, 2004; Ashcroft et al-- quantum-classical MD calculation

- **Two component Superconductivity & Superfluidity in high-pressure liquid hydrogen**
  Babaev, Sudbe, Ashcroft-- electron-proton coupling challenge
16 FACETED DIAMOND ANVILS

- Culet flat
  - 30-100 micron diameter at the culet

- Double beveled culet flat
  - 3-4 mm diameter at the girdle

Laser Illumination

Scattered light

UPPER PISTON

GASKET

LOWER PISTON
Highest pressures in solid hydrogen in a DAC ~350 GPa--Not yet metallic!

(Ruoff group; Loubeyre Group)

Highest Pressures are achieved with small culet flat diameters

To reach 5 megabars:

Sample sizes-diameters- in a DAC ~5-30 microns
The melting line of hydrogen and the states at very high pressures
The predicted high pressure melt line of hydrogen. Above the dashed line molecules are predicted to dissociate.

Will high pressure hydrogen be an atomic metallic liquid at T=0 K?

Babaev, Sudbe, & Ashcroft predict possible
• Superconducting electrons
• Superconducting protons
• Superfluid properties.
Possible limitations for study of the high temperature melting line.

At high temperatures hydrogen diffuses into the diamonds which embrittle and fail.

Solution: pulsed laser heating.
Pulsed laser heating

Sufficient time to heat to local equilibrium;
Insufficient time for diffusion.
Recent work of Attaccalite and Sorella (filled circle) confirms the extrapolation to 400 K.

Eremets and Trojan have extended the range of the melting line.
Predictions of structures of atomic metallic hydrogen solids using random structure search:
McMahon&Ceperley, PRL 106, 165302, 2011
Structures of the ground-state phases of atomic metallic hydrogen.

(a) Unit cell of \( \text{I}4_{1}/\text{amd} \) (c\(=a \geq 1 \)) at \( \sim 500 \) GPa.
(b) 2 x 2 x 1 supercell of \( \text{R}-3\text{m} \) at 1 TPa. Fictitious bonds have been drawn for clarity.
The Hydrogens at High Pressure

Unanswered Questions:

- Crystal structure of high pressure molecular phases
- Molecular or atomic
- Insulating or metallic
- Liquid at high pressure and $T=0$ K
- Crystal structure of atomic metallic phases
- Superconducting or normal metal
- Superfluidity
Challenges to be met by the new ERL x-ray source:

Assuming samples pressurized in DACs and sample sizes very small

Static Measurements

• Structure of BSP for H2, HD
• Structure of the A-phases
• Structure of metallic hydrogen
Dynamic measurements

Synchronize x-ray pulse to laser heating pulse:

Determine high Pressure-high Temperature

• Structural Phases
• Melting
• Molecular-atomic dissociation line
• Metallic? Superfluid?
The End
