

Status of ECLOUD Simulations for the Shielded Button Measurements

- I. Improvement in the simulation of e+ beam measurements*
- II. Properties of the macroparticles producing the button signal*
- III. Startling movies*
- IV. More information on the discrepancy for the e- beam measurements*
- V. Simulations for the witness bunch measurements*

All material for this talk, including full sets of the analysis plots, may be obtained at www.lepp.cornell.edu/~crittenten/cesrta/ecloud/14apr10

Jim Crittenden

Cornell Laboratory for Accelerator-Based Sciences and Education

Electron Cloud Meeting

14 April 2010

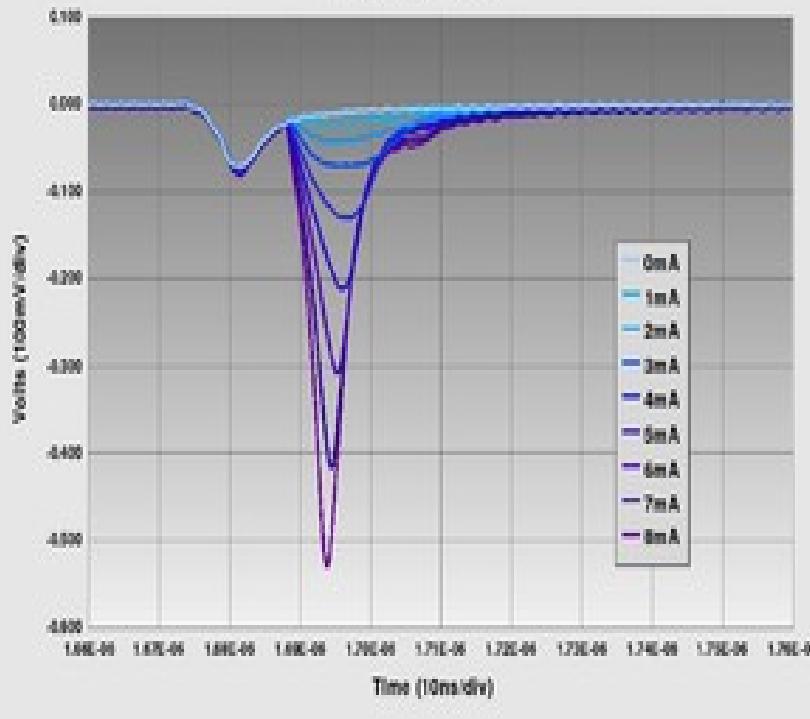

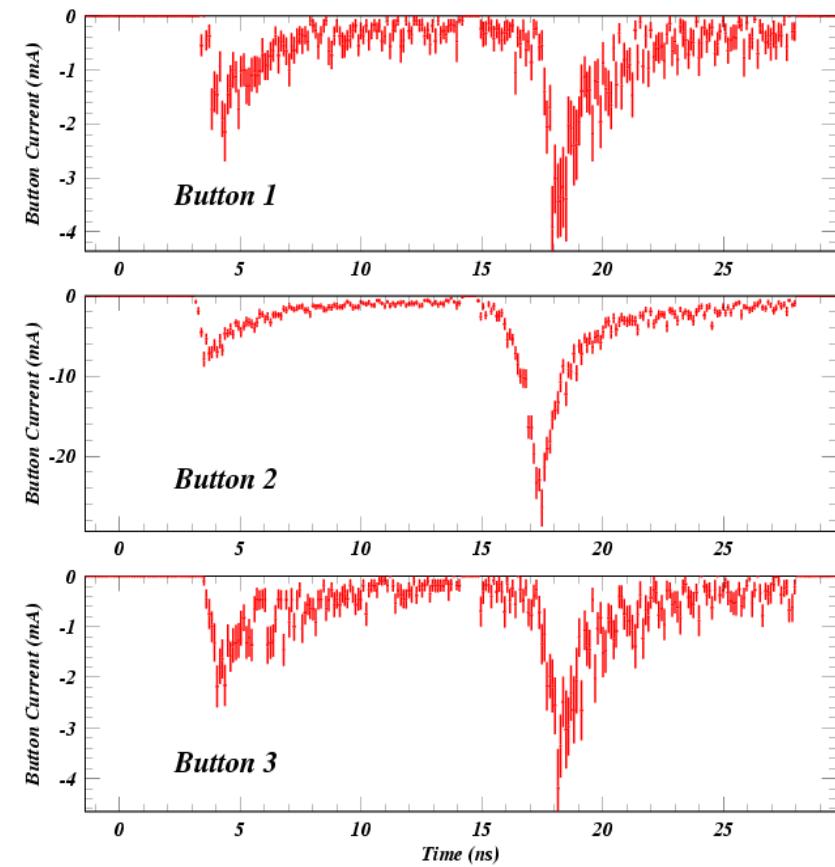

Measurement (Central Button)

15E 8mA Positron Bunch, Add 2nd Bunch 14ns Later

Button Bias +50V

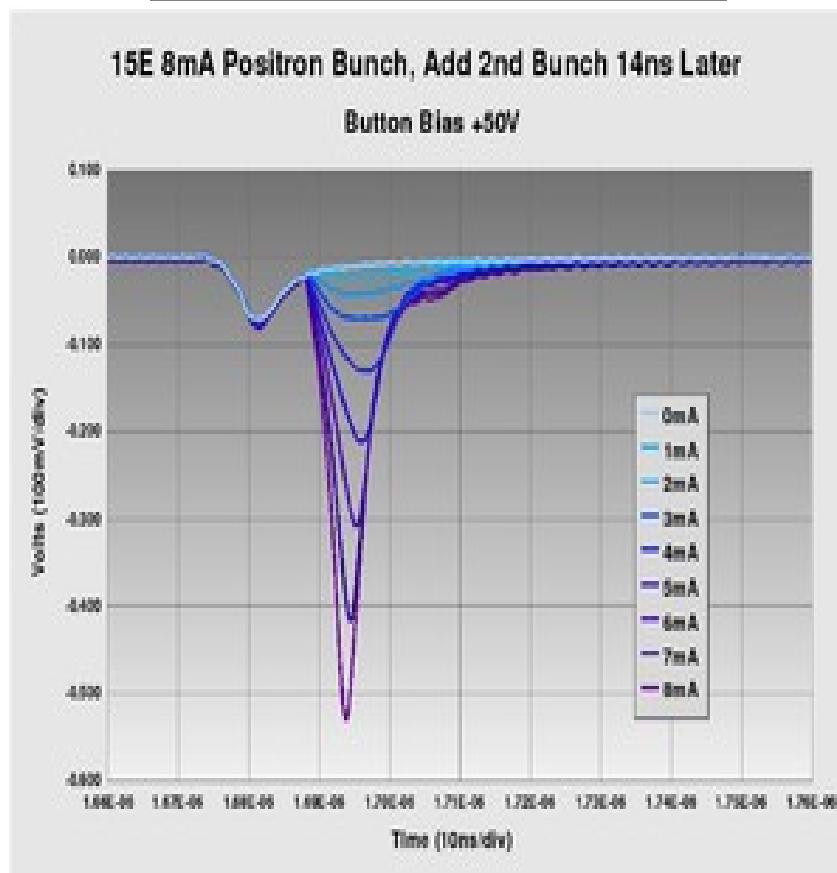

ECLOUD Simulation

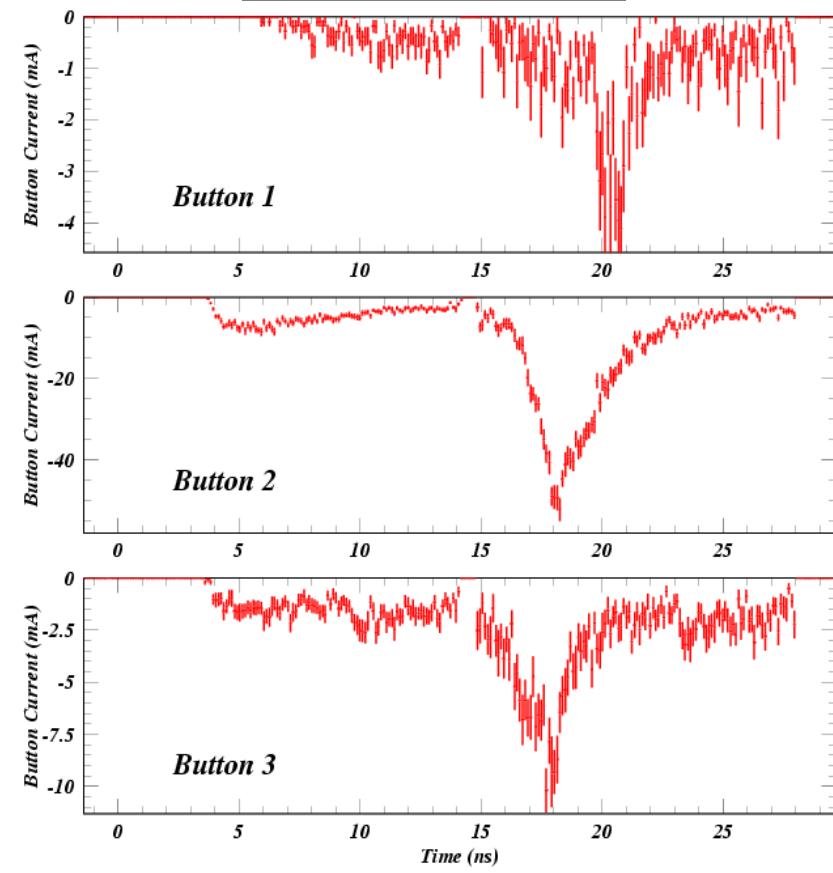

The ratio of the second peak in the button 2 signal to the first was only about a factor of four.

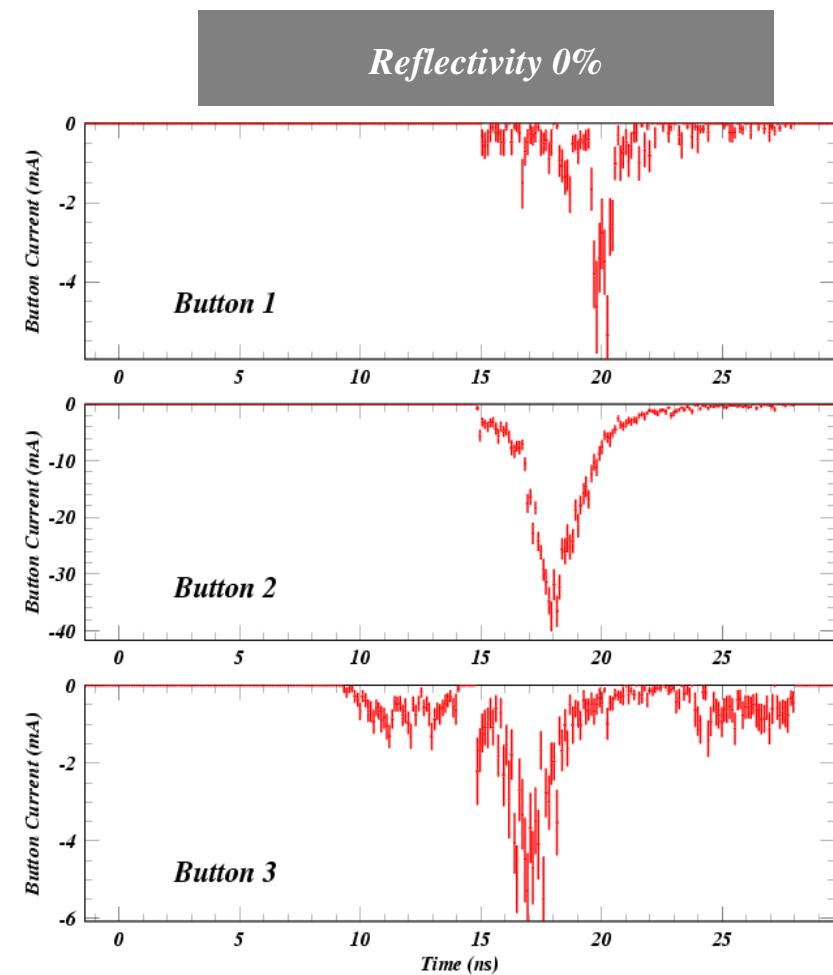

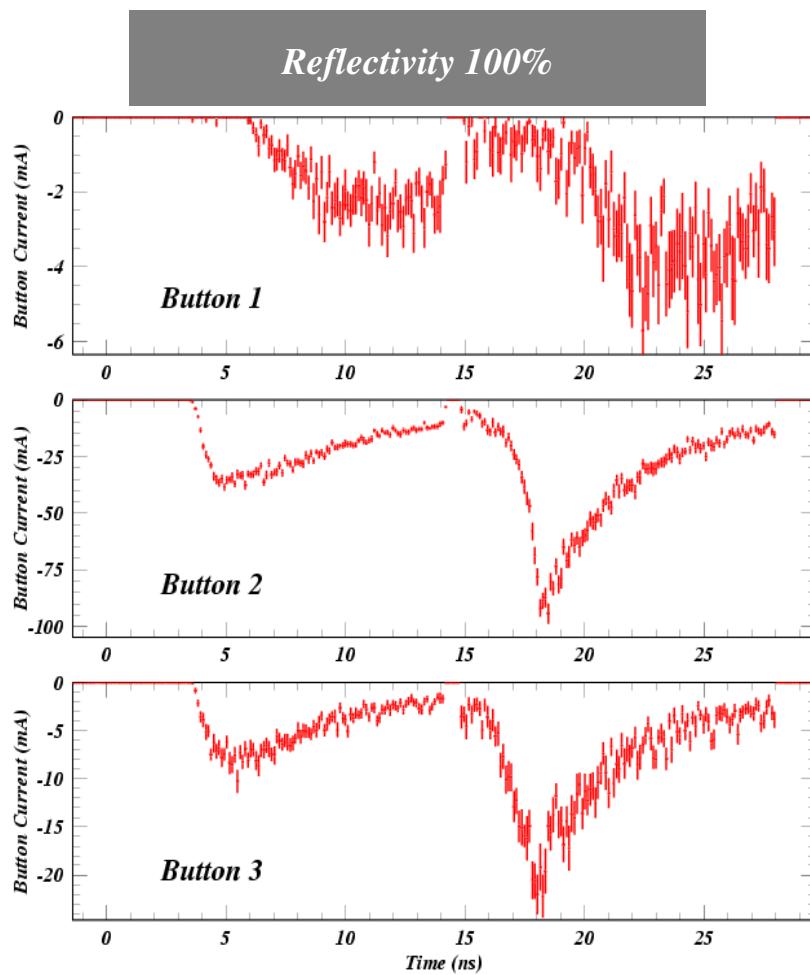

Measurement (Central Button)

ECLOUD Simulation

The ratio of the two peaks is much better reproduced when the 12 mm offset of the beam axis is included.

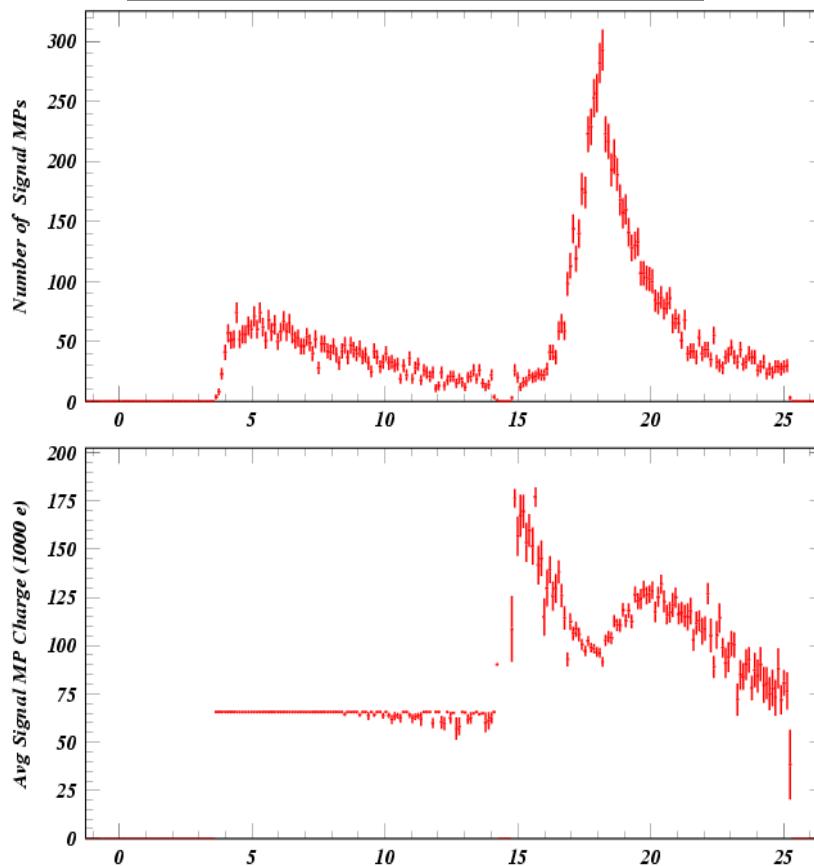

The ratio of the two peaks is sensitive to the azimuthal distribution of primaries.

The first bunch gives no button signal if no primaries are produced in the region of the shielded button.

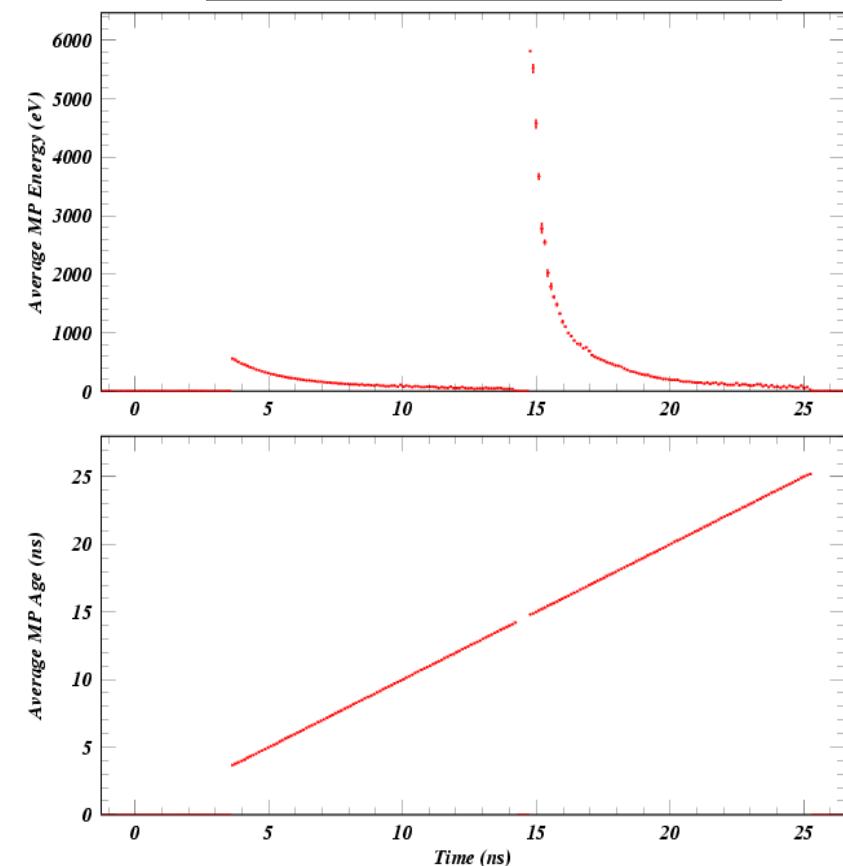

A value for the reflectivity of 20% gives a good match to the measured ratio.

Average Number and Charge

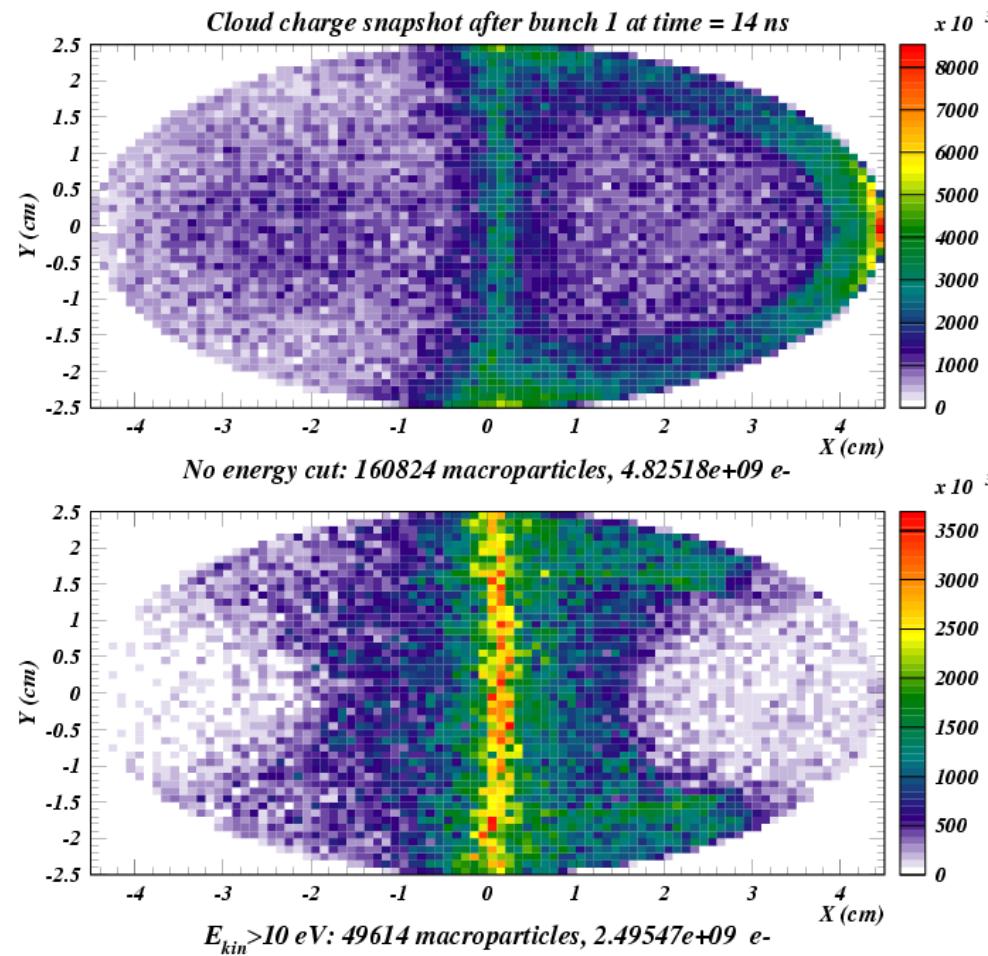

Average Energy and Age

Post-processing of 11k cloud macroparticles entering the detector. Averages over 0.11 ns are shown here.

Primaries are generated with the same charge value of about 65k e. The button signal is a convolution of macroparticle number and charge.

The bunch charge of 1.28×10^{11} e (8 mA) is sufficient to generate kinetic energies of 6 keV during passage of the second bunch.

Unexpected result for the cloud snapshot at the arrival time of the second bunch.

A vertical stripe moving horizontally reaches the central button just as the second bunch arrives, as shown in the following movie.

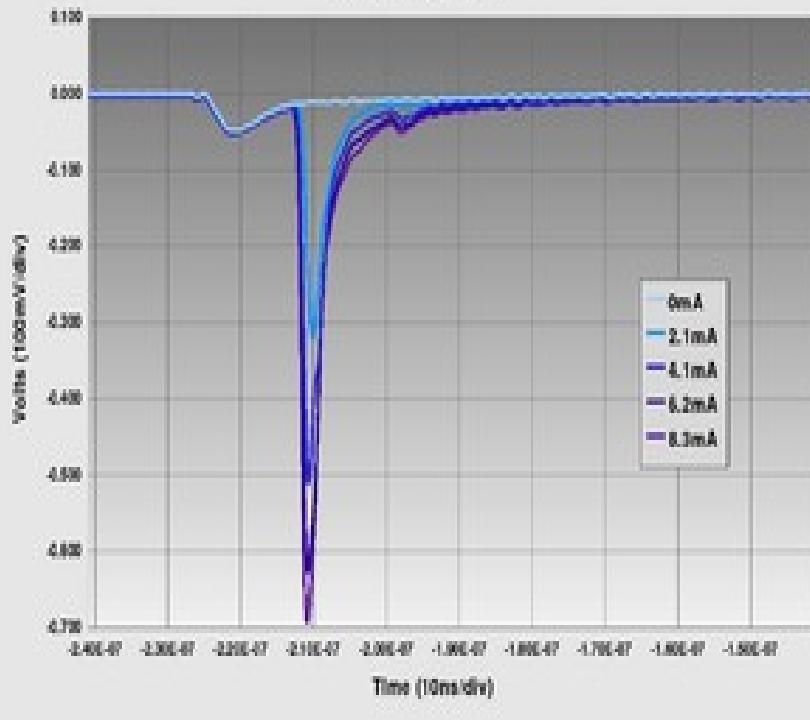

The movie has 10 snapshots during the bunch passage and 40 snapshots between bunch passages.

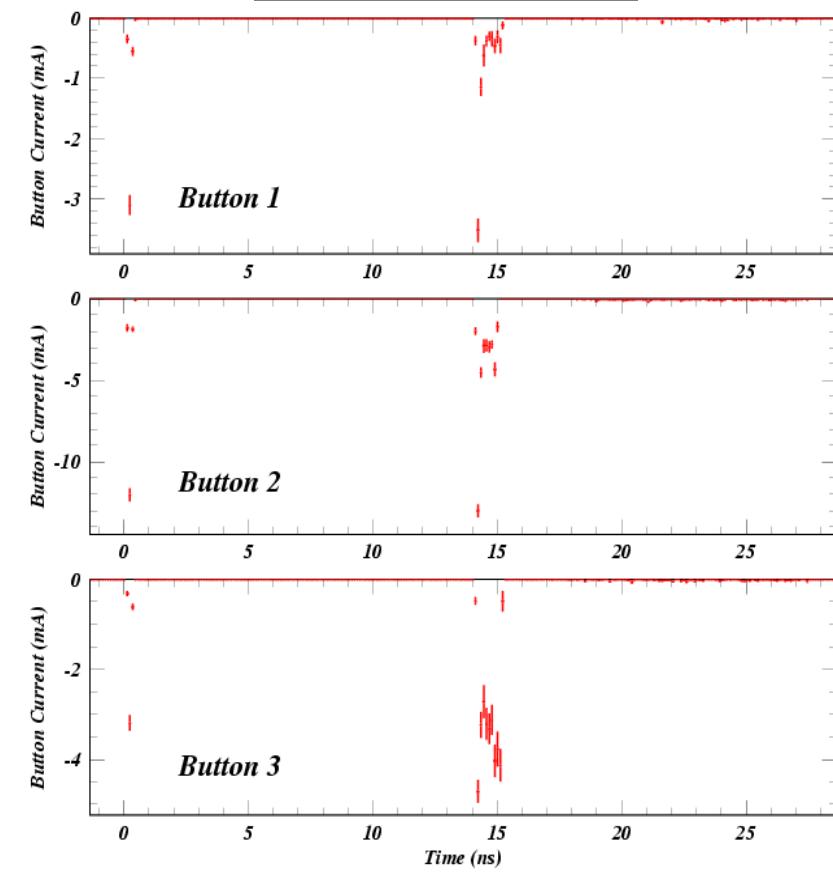

Measurement (Central Button)

15E 8.6mA Electron Bunch, Add 2nd Bunch 14ns Later

Button Bias +50V

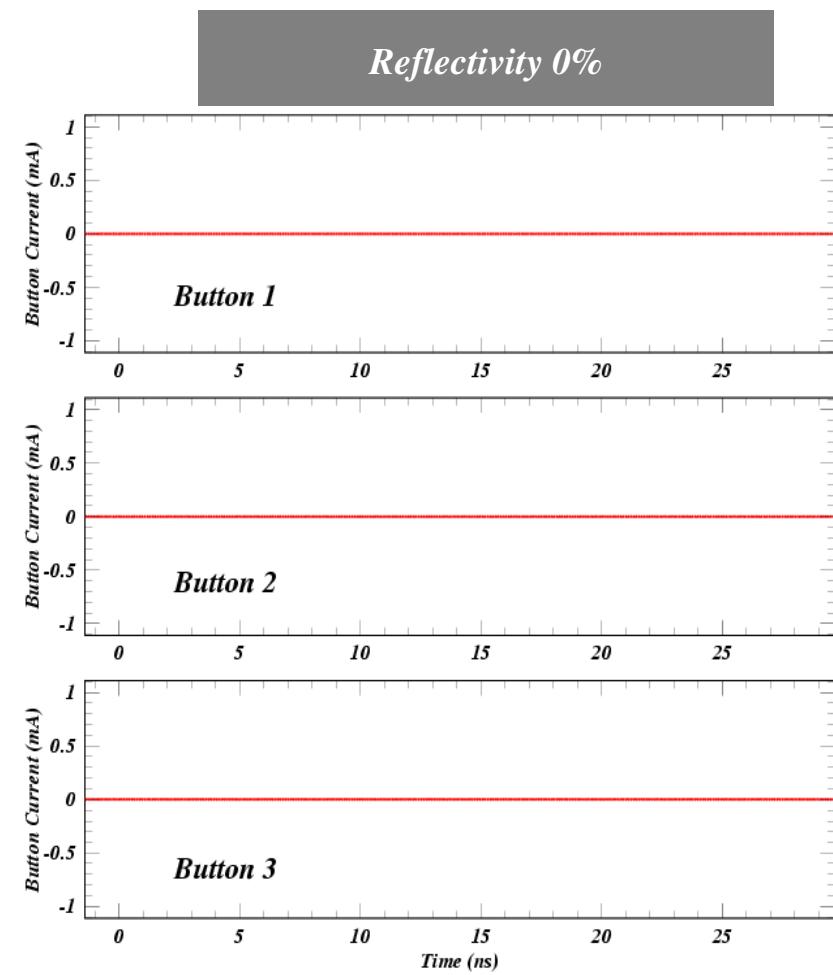

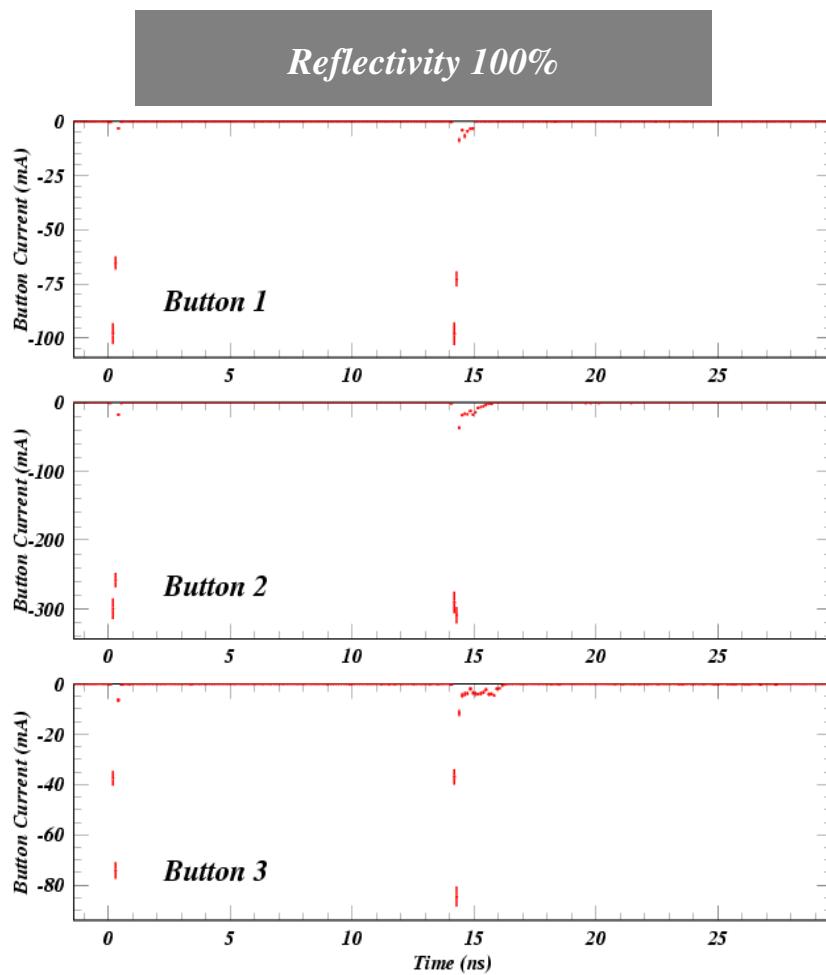

ECLOUD Simulation

Today I will be brief on the simulation for the electron beam, because we don't yet understand it.

However, I will show some important differences from the positron beam, and can quantitatively exclude one speculative source of the discrepancy in the time structure (mp transit time in the detector).

The reflected-photon contribution accounts for ALL of the signal in the case of an electron beam.

Bunch population	N_b	1.28e11 (8 mA)
Number of bunches	N_b	2
Bunch gap	$Ngap$	n.a.
Bunch spacing	$L_{sep}[m]$	4.2 (14 ns)
Bunch length	$\sigma_z [mm]$	e+: 18.8 e-: 18.8
Bunch horizontal size	$\sigma_x [mm]$	e+: 0.222 e-: 0.205
Bunch vertical size	$\sigma_y [mm]$	e+: 0.0185 e-: 0.0191
Photoelectron Yield	Y	0.1
Photon rate ($\gamma / m / e$)	dn_γ/ds	e+: 1.00 e-: 0.3
Antechamber protection	η	n.a.
Photon Reflectivity	R	e+: 20% e-: 67%
Max. Secondary Emission Yield	δ_{max}	1.0 (0.9 t.s. & 0.1 rediff)
Energy at Max. SEY	$E_m [eV]$	400
SEY model	Cimino-Collins ($\delta(0)=0.5$)	

SEY estimated for processed TiN.

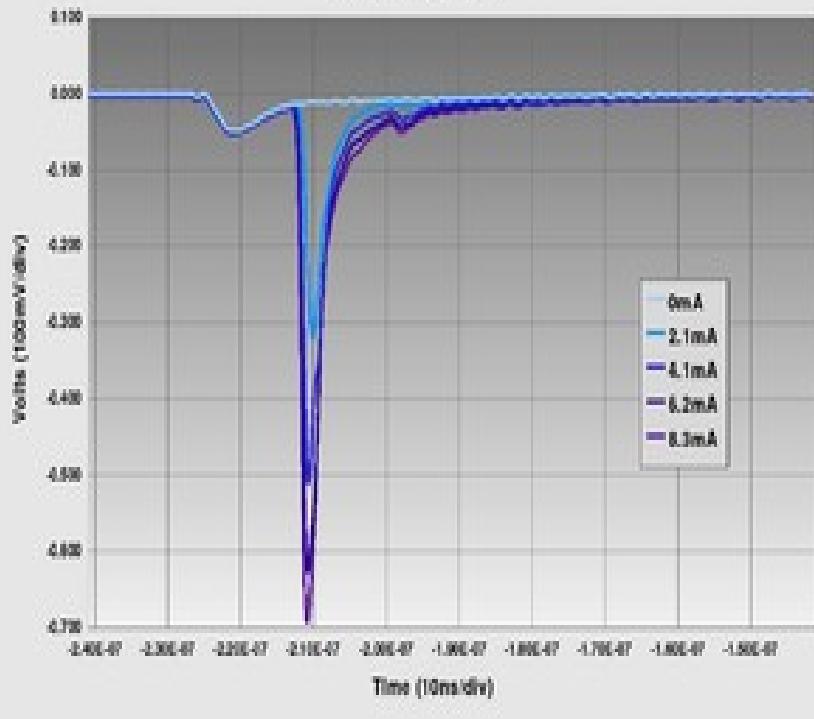

Numerical parameters large: 1000 steps, 101 kicks, 250k m.p. per bunch, 4000 steps between bunches.

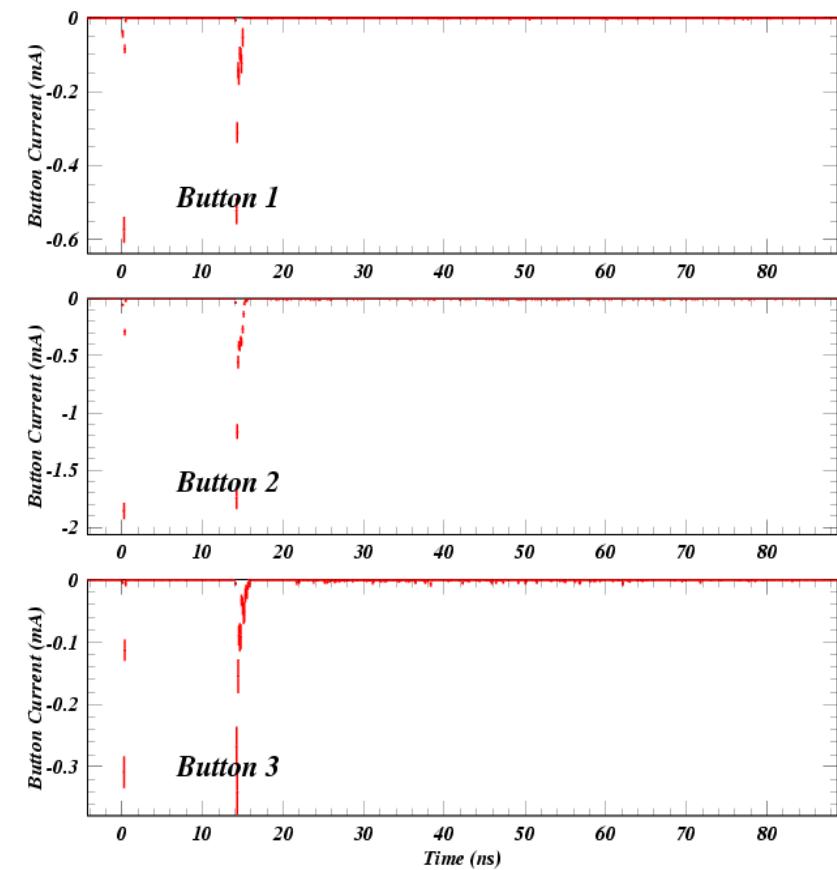

Measurement (Central Button)

15E 8.6mA Electron Bunch, Add 2nd Bunch 14ns Later

Button Bias +50V

ECLOUD Simulation

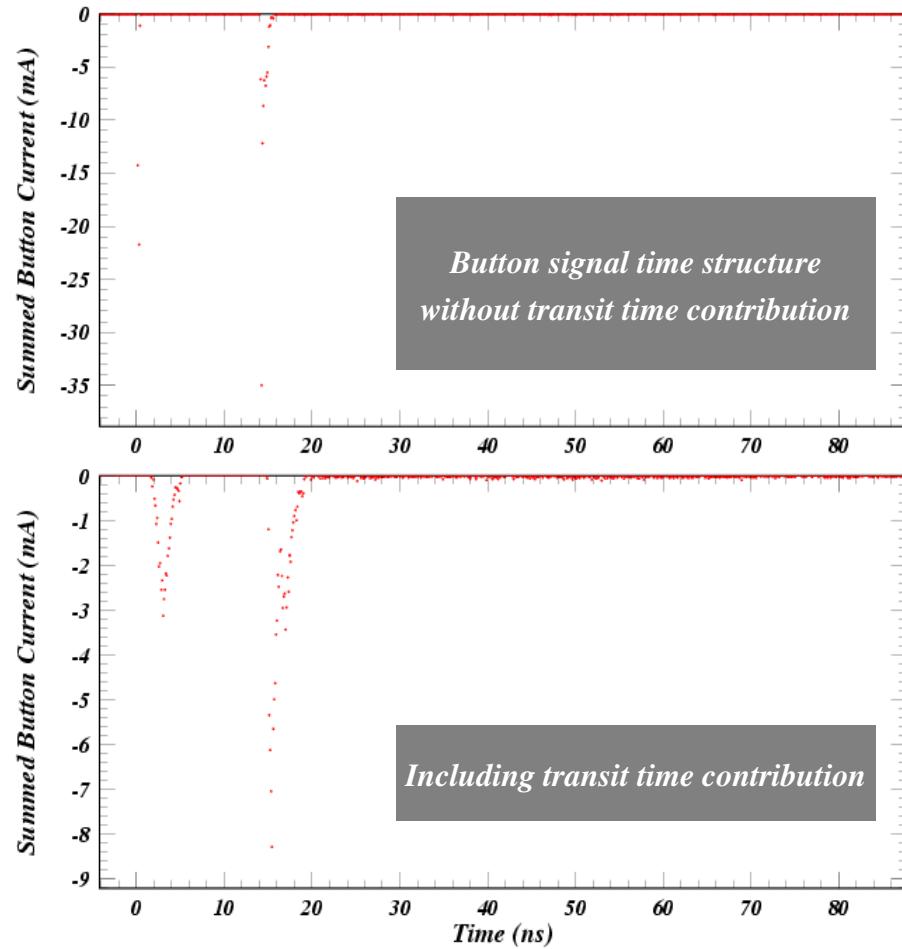

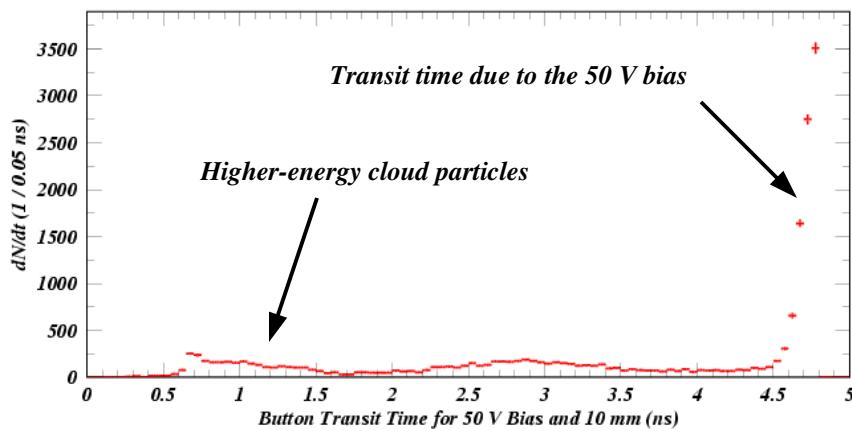

The simulated signal is prompt, and very brief, unlike the measurement.

In particular, where is the signal between bunches coming from the cloud self-repulsion?

Transit time distribution

for 50 V bias and 10 mm button distance (overestimated)

Postprocessing for 17.4k cloud particles.

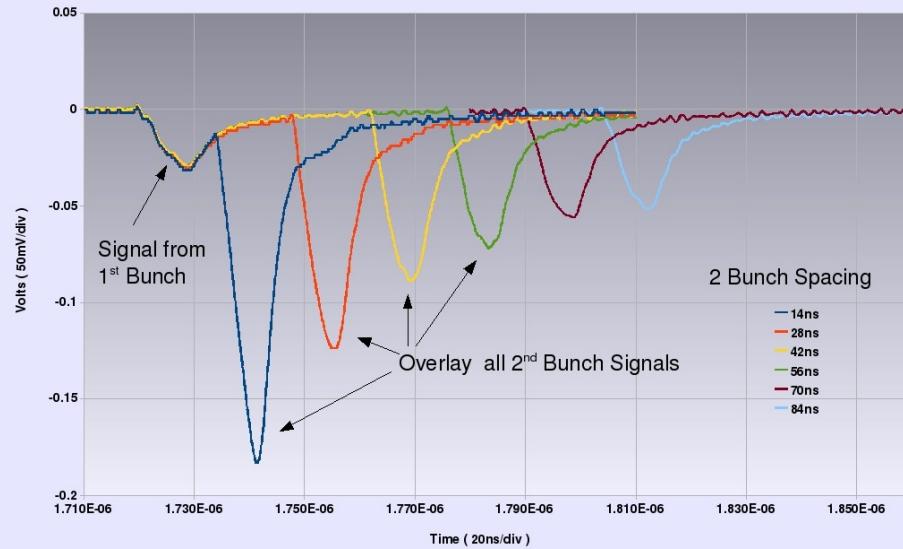

The 50 V button bias dominates the contribution to the transit time.

Despite overestimating the distance to the button, the transit time spread cannot account for the signal time structure.

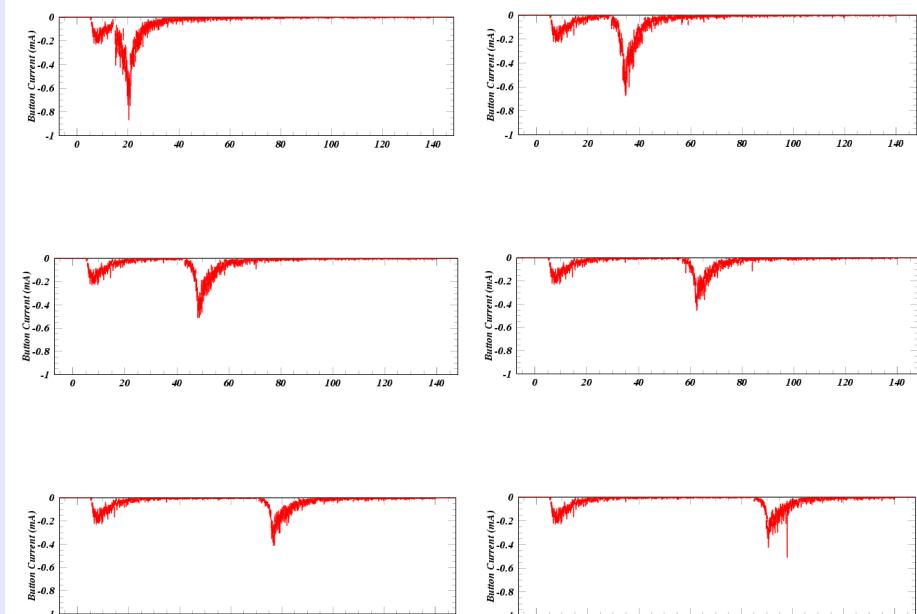

Measurement (Central Button)

Electron Cloud Decay Time
Using 2 Positron Bunches at 5.3GeV

ECLOUD Simulation

The success of the simulation for a positron beam opens up a broad range of inquiry.

Will we be able to derive an estimate for $\delta(E=0)$ from such cloud lifetime measurements?
